## Cefizox (Ceftizoxime)

??? ??????: 30 ?????2/????? 2017

Cefizox® (ceftizoxime for injection, USP) is generally well tolerated.

**The most frequent adverse reactions (greater than 1 % but less than 5%) are:**

Rash, pruritus, fever. **Hypersensitivity:**

Transient elevation in AST (SGOT), ALT (SGPT), and alkaline phosphatase. **Hepatic:**

Transienteosinophilia, thrombocytosis. Some individuals have developed a positive Coombs test. **Hematologic:**

Burning, cellulitis, phlebitis with IV administration, pain, induration, tenderness, paresthesia. **Local†Injection site:**

**The less frequent adverse reactions (less than 1%) are:**

Numbness and anaphylaxis have been reported rarely. **Hypersensitivity:**

Elevation of bilirubin has been reported rarely. **Hepatic:**

Transient elevations of BUN and creatinine have been occasionally observed with Cefizox (ceftizoxime) . **Renal:**

Anemia, including hemolytic anemia with occasional fatal outcome, leukopenia, neutropenia, and thrombocytopenia have been reported rarely. **Hematologic:**

Vaginitis has occurred rarely. **Urogenital:**

Diarrhea; nausea and vomiting have been reported occasionally. **Gastrointestinal:**

). **WARNINGS** Symptoms of pseudomembranous colitis can appear during or after antibiotic treatment (see

In addition to the adverse reactions listed above which have been observed in patients treated with ceftizoxime, the following adverse reactions and altered laboratory tests have been reported for cephalosporin-class antibiotics:

Stevens-Johnson syndrome, erythema multiforme, toxic epidermal necrolysis, serum-sickness like reaction, toxic nephropathy, aplastic anemia, hemorrhage, prolonged prothrombin. Several cephalosporins have been implicated in triggering seizures, particularly in patients with renal impairment, .) If seizures associated with drug therapy occur, the drug should be **DOSAGE AND ADMINISTRATION** when the dosage was not reduced. (See discontinued.

Anticonvulsant therapy can be given if clinically indicated.
