Cetacaine (Benzocaine, Aminobenzoate and Tetracaine)

??? ??????: 30 ?????2/?????? 2017

Unpredictable adverse reactions (ie, hypersensitivity, including anaphylaxis) are extremely rare. **Hypersensitivity Reactions:**

Localized allergic reactions may occur after prolonged or repeated use of any aminobenzoate anesthetic. The most common adverse reaction caused by local anesthetics is contact dermatitis characterized by erythema and pruritus that may progress to vesiculation and oozing. This occurs most commonly in patients following prolonged self-medication, which is contraindicated. If rash, urticaria, edema, or other manifestations of allergy develop during use, the drug should be discontinued. To minimize the possibility of a serious allergic reaction, Cetacaine (benzocaine, aminobenzoate and tetracaine) preparations should not be applied for prolonged periods except under continual supervision. Dehydration of the epithelium or an escharotic effect may also result from prolonged contact.
